Foreword

By Dr. Charlotte de Fontaubert, World Bank

We are pleased to be associated with the publication of these reports on the circular economy in the island states of Africa and of the Indian Ocean, which aim at accelerating a development that respects the environment and that is resilient to climate change. These documents, produced by the Indian Ocean Commission (IOC) as part of the implementation of the sub-component AIODIS of the second project on the Governance of fisheries and shared growth in the South-West Indian Ocean (SWIOFish2), deal with three important aspects of circular economy in the AIODIS countries: (i) the state of the circular economy, (ii) the questions of intellectual property with regard to innovative projects and (iii) the prevention, reduction and control measures of marine plastic pollution.

The World Bank has supported, since 2015, the countries of Africa and of the South-West Indian Ocean to meet the Sustainable Development Goals (SDGs) of the United Nations. To this end, we help several countries in their transition to a more sustainable ocean economy (SDG 14). The principle of blue economy is precisely a sustainable use of marine resources to stimulate economic growth, livelihoods and employment, while preserving the health of the ocean ecosystems. In that sense, the World Bank finances regional programmes on fisheries management in the islands of the Pacific, the Caribbean, West Africa and South-West Indian Ocean. It is in this context that lies our SWIOFish2 project in coordination with the IOC.

The first objective of the project is to assist these States to grasp and to increase the economic, social and environmental advantages of blue economy. This can be achieved by improving the management of their marine resources, namely by limiting the depletion of the fish stocks. This is also possible through an increase in alternative livelihood activities for targeted fishermen, and a reinforced regional cooperation in this sector.

With the sustainability of these resources under serious threat, addressing the sources of these multiple and interconnected threats requires us to rethink our entire economy. From the World Bank's perspective, this is why we are committed to supporting these states in their journey towards a circular economy that is best described as a restorative or regenerative industrial system by intent and design.

We are confident that by pooling their experiences and their initiatives through the AIODIS cooperation mechanism, these States will be able to better face their common challenges. Overcoming these challenges will require the use of sufficient technical and financial means coming from institutional frameworks and infrastructure conducive to the development of a circular economy. Thus, it was essential to identify them for each country, so as to set up the foundations of a framework that is adapted to different socio-economic contexts. Endowed with this new knowledge, we can henceforth move forward together towards a circular economy that brings sustainable and inclusive growth opportunities.

Foreword

Plastic: a marker of our times and a responsibility for action

By Prof. Vêlayoudom Marimoutou,
Secretary General of the Indian Ocean Commission

**“The obligation to suffer gives us the right to know.”
Jean Rostand**

Biologist Commoner draws our attention on one of the characteristics of human action: *"its capacity to produce materials that cannot be found in nature"*, and therefore *"to introduce in the system substances that are utterly unknown to it"*. The great circular economy of nature, in which *"nothing is lost, but everything is transformed"*, is more and more upset and disturbed by human manoeuvres.

The Modern world is also a world of pollution and, as Barnosky said in 2014, today *"there are few places on earth that are not affected by man-made environmental pollutants. It is common to find traces of pesticides and industrial pollutants in samples of soil and tree bark of any forest in the world, in whales' fat, in the body of polar bears, in fishes of most of the rivers and oceans"*. Pollution has become one of the major problems of our times; local or global, of agricultural, industrial or urban origin, it contaminates the lands, the waters and the atmosphere, jeopardising the health of the ecosystems and thereupon that of humans.

Plastic is emblematic of pollution in general

In 2016, J. Zalasiewikz and his colleagues propose to use plastic as an emblematic signature of the general pollution of the Earth's ecosystem characterising the Anthropocene epoch. Plastics are polymers manufactured from petrochemicals, although some are made from cellulose (8% of petrol extracted on the planet, half as raw material). Adapted to multiples uses, plastic impresses with its theoretical capacity to infinite recycling and to the promise of saving natural resources, and because of its hygienic qualities which led to its adoption in pharmacies and hospitals. From the 1950s onwards, it has grown with mass consumption, on the back of synthetic materials and on the rising production of disposable items. It has rapidly become an essential component of electronics and informatics.

Despite its theoretical infinite recycling capacity, we are far from the mark: it is estimated that 50% is recycled or converted into energy (pyrolysis), the proportion recycled being 15% to 25% in Europe and less than 5% in the USA. We therefore have an idea of the amount of plastic debris dispersed each year, in the form of fragments smaller than 5 mm, or even nano plastics, in the environment. Lightweight, easily transported by wind or water, plastic debris has invaded the entire planet, including the oceans, where it is dispersed from the surface to the bottom of ocean basins. The lightest plastics form areas of highest concentration around the 5 major ocean gyres. They represent a total of 25,000 tonnes of floating debris on the sea surface.

Invasion, resistance and toxicity

The problem posed by this pollution is two-fold.

The first is its resistance. Depending on their composition, the degradation of plastics takes between 50 years and 5 centuries, or even millennia for debris to sink to the deep seabed. If we take into account both this resistance to degradation and the 5 to 13 million tonnes of debris that reach the world's oceans each year, we can see the scale of the problem we are building. And according to B. Montsaignon, 'bioplastics' cannot provide a real solution: their manufacture from plant materials does not guarantee the biodegradability of polymers, and moreover it increases industrial pressure on agricultural land; as for those that are claimed to be compostable or fragmentable, they are still derived from petrochemical products.

Second is its toxicity: 50% of the chemical components of plastics are classified as hazardous by the United Nations classification system for chemicals. Studies have also shown the ability of additives used in PVC to pass into the human bloodstream, as well as the carcinogenic risks of certain components of PVC, polystyrene, polyurethane and polycarbonate. Similarly, biologists have warned of the risks that plastic debris poses to fauna, from micro-organisms to whales or seabirds, which are part of the food chain right up to our plate.

Rethinking the models, blue and circular

So, what should we do?

Regeneration, reinvention and restoration form a new framework for action to (re)think our strategies, to innovate and to provide solutions to this global challenge, which raises significant local issues in island territories. It is not a question of going to war against plastic, which has proved to be a useful, practical and inexpensive material. It is a question of analysing our relationship with this material, of defining new ways of consuming and producing it, and of developing innovative ways of disposing of it and reducing the pollution generated on our coasts and at sea.

To address the multifaceted challenge of marine plastic pollution in the islands of Africa and the Indian Ocean, the IOC and the World Bank, through the AIODIS component of the IOC-SWIOFish2 project, are publishing three studies on i) the state of the art of the circular economy, ii) intellectual property issues on innovative projects and iii) measures to prevent, reduce and control marine plastic pollution. We hope that they will prove useful to policy makers, entrepreneurs, and developers in the blue and circular economy sectors.

Introduction

This is a background study for prevention, reduction and control of marine plastic pollution in Africa Indian Ocean Developing Island States (AIODIS). The AIODIS included in the study are: Cape Verde, Comoros, Guinea Bissau, Madagascar, Maldives, Mauritius, São Tomé and Seychelles. La Réunion is a member of the AIODIS group, but is not included in the study. The study has a particular focus on development of sensitisation strategies and the role of the circular economy.

Part I summarises global and regional characteristics of marine plastic pollution (MPP). It describes the complexity of the MPP problem and the challenges facing governments, industries and consumers. It describes the scale of the problem, the nature of plastics, the structure of the plastics economy and global trade in plastics. It quantifies the impacts on economies and on the environment and on biodiversity. Part I sets out the problem of MPP in the context of international law, describes initiatives to build an international convention to prevent, reduce and control plastic waste, and briefly describes actions under two regional seas conventions.

Part II addresses marine plastic pollution in AIODIS and builds on inputs from AIODIS stakeholders through Country Working Papers.

Part III describes the range of approaches and initiatives to prevent, reduce and control marine plastic pollution, with specific reference to the circular economy, to building awareness and to the challenges in AIODIS and small/ island economies.

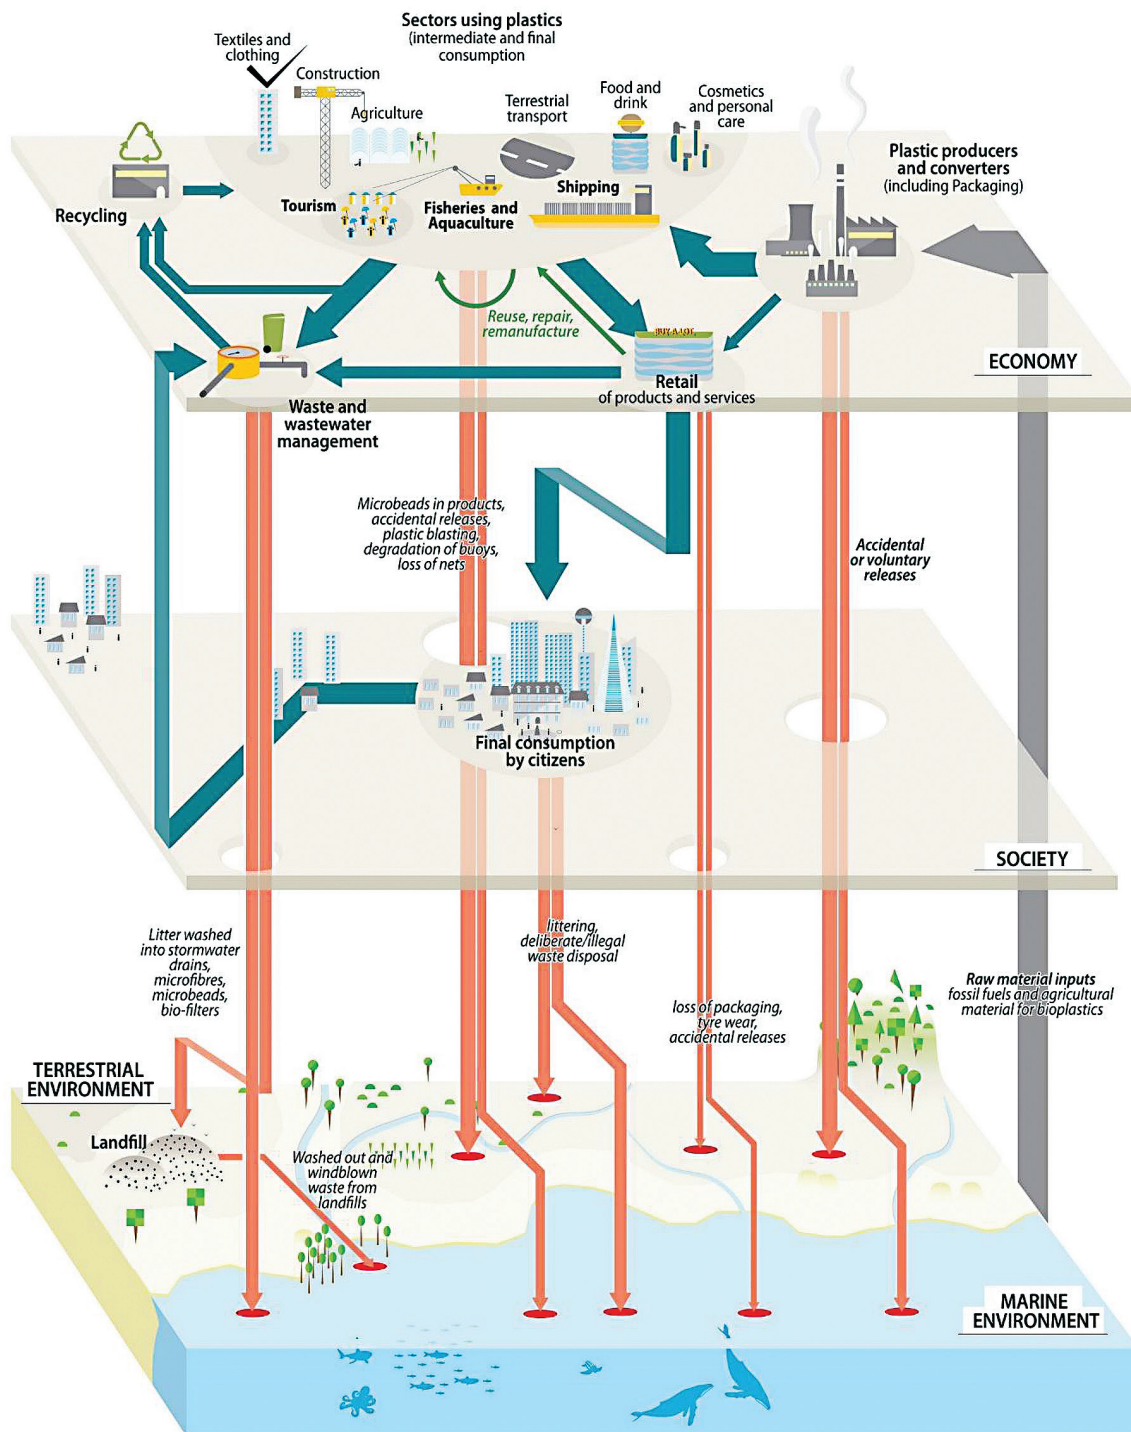

The report sets out and builds on several conclusions:

- a clear understanding of the integrated nature of the problem of MPP is important for development of a national action plan to combat MPP
- public awareness of the problem is fundamental to building the political willingness for actions, as actions can incur costs for consumers, for businesses, for local authorities and to public finance
- consumers and businesses need to be engaged through stakeholder consultation and participation
- MPP is part of a more general waste management problem, in particular, the management of urban solid waste and waste generated by shipping and fisheries activities
- governments will require coherent policies, regulatory measures, public support for waste management, incentives for changes in consumer and business behaviours and support for innovation in and adoption of the circular economy in the business community
- in the AIODIS, national resources and efforts may need to be supplemented by external financial resources, including for private sector investment and technologies
- national actions should ideally be complemented with regional and global actions to be effective, as the problem of MPP is global, requiring actions across sectors and economies
- given the small size of many AIODIS economies, actions to combat MPP can benefit from a regional approach on trade in plastics and plastic waste which may generate the economies of scale and opportunities for a circular economy approach.

This report is a companion report for other reports to be prepared under this project. These other reports will examine the role of the circular economy in addressing plastic waste and plastic pollution in more detail and will also examine intellectual property rights, particularly those associated with circular economy technologies and initiatives.

This work is financed by the World Bank under the 'Promotion of African & Indian Ocean Island Developing States Blue Economy' component of the regional 'South West Indian Ocean Fisheries Governance and Shared Growth Project' (SWIOFish2). The component is managed by the Indian Ocean Commission.

Figure 1. How plastic pollutes the marine environment

EXECUTIVE SUMMARY

Key Messages

The **objective** of the study is to compile and present information on key aspects of marine plastic pollution to enable AIODIS to consider national and regional actions to combat marine plastic pollution with particular emphasis on awareness and the circular economy.

A. What is the Marine Plastic Pollution problem?

1. Marine Plastic Pollution (MPP) is growing in AIODIS and worldwide. There are numerous social, economic and environmental impacts. The impacts are complex, cumulative, largely irreversible and difficult to quantify.
2. MPP results in estimated global losses of over \$2 billion/year. The losses are disproportionately suffered by island economies. Losses for AIODIS have not been estimated but are considered significant, particularly for tourism, public health and the cumulative loss of ecosystem function.
3. MPP is part of a more general solid waste management (SWM) problem, in particular the management of urban solid waste and waste generated by shipping and fisheries.
4. Global, regional and national actions are not significantly halting or reversing global MPP.
5. Multiple actions across the entire plastics value chain with greater commitments by business stakeholders and concerted international actions are considered fundamental to effectively prevent, reduce and control MPP.

B. How are AIODIS combatting Marine Plastic Pollution?

1. Countries are developing increasing awareness of 'the plastics problem'. All AIODIS have introduced restrictions on single-use-plastic bags. All countries have beach clean-up activities.
2. Only one country has a comprehensive action plan on MPP.
3. Only South Asia has a regional action plan on marine debris.
4. There are no regionally binding measures on MPP and no regional agreements facilitating sustainable trade in plastic waste.
5. The implementation and effectiveness of the two existing regional protocols on land-based sources of marine pollution has not been evaluated in relation to MPP.
6. All countries face technical, resourcing and institutional fragmentation challenges with respect to SWM. Deficient solid waste management (SWM) is the major cause of MPP.
7. There is limited business engagement in combatting MPP. Circular economy initiatives and extended producer responsibility schemes are in their infancy.

C. What more can be done to prevent, reduce and control MPP?

National actions

1. Countries can develop implement comprehensive national MPP action plans.
2. The plan should be an integral part of the national SWM plan, engage stakeholders across the plastics value chain, link to the national vision, the SDGs, and to relevant national environmental, social and economic initiatives.
3. The plan should have a strong regional cooperation component and address trade issues.

Regional actions

1. MPP requires global and regional cooperative efforts, as the problem and the solutions are beyond the capabilities of single countries.
2. Actions at all levels will benefit from enhanced regional cooperation.
3. Ideally, regional action plans should be prepared with effective engagement of the regional economic communities and organisations.
4. A regional action plan should include a trade dimension, help access resources and finance, and help establish a regional position on MPP.
5. Ideally, the action plan should foster development of a binding agreements on measures to combat MPP.

7 Mauritius

7.1 Marine plastic pollution in Mauritius

Mauritius does not currently have a comprehensive national strategy to address marine plastic pollution (MPP).²⁶⁵ This report is a first step to estimate the scale of MPP, to describe the sources of MPP and to develop a national dialogue and action plan on MPP. It places particular emphasis on the use of the existing solid waste management system and awareness-building initiatives; on environmental sustainability policies, on development of the circular economy, on regional cooperation and on identifying practical steps to combat MPP. The report is a working paper intended as a basis for stakeholder consideration and to be used to develop more in-depth analyses, to help align existing activities in Mauritius, to identify possible gaps and areas requiring additional efforts.

7.1.1 Sources of marine plastic pollution

There are three main sources of MPP in Mauritius:

- mismanaged, or unmanaged solid waste and litter, which are the most important
- marine sources which are mainly fishing activities, shipping and beach tourism, and
- plastics that may be transported by ocean currents from other countries.

The different sources are discussed in more detail below. Plastic waste is part of a much broader waste management problem, one of a range of sustainable development challenges faced by Mauritius. The following sections provide a preliminary estimate of marine plastic pollution (MPP) in Mauritius and provides a synthesis of available information on MPP, including on microplastic marine pollution.

7.1.2 Estimate of marine plastic pollution and its basis

MPP is estimated primarily as a function of mismanaged land-based solid waste in Mauritius with some additions to reflect the marine sources.²⁶⁶ The estimate of MPP relies on several assumptions based on population, solid waste generation, the proportion of plastic in the waste and the amount of mismanaged plastic waste that is transported into the marine environment. The basis for these assumptions is set out below. Alternative estimates of mismanaged plastic waste have not been explored at this stage.²⁶⁷

The country has a population of over 1.27 million, of which 40.8 percent are considered urban.²⁶⁸ Population density is 626 per km², among the highest of African countries. For the purposes of the MPP estimate, the entire population is considered to be 'coastal'. This means that mismanaged plastic waste in any part of Mauritius could potentially be transported to the sea by rain, flooding, wind, or deliberate dumping or littering on the shore, or at sea.

About 98 percent of household solid waste is collected and about 84 percent of total waste is collected. Almost all waste is considered effectively managed. Some households compost bio-waste and several industries have specific means of waste disposal and may transport waste to the only managed sanitary landfill site where all unused, or non-recycled waste is disposed. About 1,488 tons of waste

²⁶⁵ MPP is generally considered to account for about 80 percent of marine litter or debris.

²⁶⁶ See Jambeck et al., 2014 for a description of the methodology.

²⁶⁷ Cordier, M. et al, 2020. Plastic pollution and economic growth: the influence of corruption and the lack of education. 2020. <https://hal.archives-ouvertes.fr/hal-02862787..>

²⁶⁸ World Bank, 2019. <https://data.worldbank.org/>.

are generated daily.²⁶⁹ Total solid waste has been increasing at a rate of 1.5 percent per year from 480,000 tons in 2015. In 2019, the reported solid waste landfilled at Mare Chicose was 537,147 tonnes, 1.1 percent less than in 2018 (543,197 tonnes). An additional 6 percent of total waste is directed to composting and does not go to Mare Chicose. The per capita landfill was 1.22 kg/person/day in 2018.²⁷⁰ The total solid waste generated in 2019 is estimated at over 570,000 tons.

Several studies indicate a high proportion of plastic in Mauritius solid waste, estimated at about 12.4 percent in Port Louis and as much as 14 percent in 2018.²⁷¹ The proportion of plastic in waste varies between industrial (6 percent), commercial (16 percent) and domestic (15 percent) sources.²⁷² For the purposes of the estimate, 10 percent of waste is conservatively considered to be plastic. This gives a total estimated quantity of plastic waste of at least 57,000 tons/year.²⁷³

While solid waste is well-managed in Mauritius, some 'leakage' is evident from beach clean-ups. It is assumed that 2 percent of plastic waste is 'unmanaged', either as a result of littering, illegal dumping, or smaller items entering waste water, or sewage.²⁷⁴ The hydrography and high seasonal rainfall of Mauritius is such that any plastic litter which is not collected is likely to be washed into the numerous ravines and eventually into the sea. There appears to be few storm drain traps or other means to prevent debris entering the sea, although the national budget provides significant funds for cleaning of drains, roads, rivers and public sites.²⁷⁵ It is assumed that 10 percent of the mismanaged plastic waste leaks into the ocean.

The estimate of microplastic marine pollution is based exclusively on tyre abrasion and is estimated at 17-102 tons/year. This estimate, its basis and underlying assumptions described below (0).

The import of fishing nets is used as a proxy for generation of MPP from fisheries. In 2019, the imports of monofilament nets were 67 tons and 10 percent of this quantity is considered to be lost or abandoned nets and gear and effectively MPP.²⁷⁶

Comprehensive information on MPP from shipping and from non-Mauritius sources is not available and the values in are placeholders which can be replaced with estimates based on any future assessments. The generation of MPP from solid waste mismanagement, from fisheries, from shipping and from non-Mauritius sources (e.g., ocean currents) are further discussed in other sections below.

²⁶⁹ A 2015 study indicated that waste generation rates for SIDS averaged 1.29 kg/capita/day, while OECD countries had a mean value of 1.35kg/capita/day. See also: Mohee, Romeela et al. 2015. Current status of solid waste management in small island developing states: A review. Waste Management 2015 43 p. 539-549. A rate of 1.11 kg/person/day was reported for 2017. Africa Solid Waste Management Data Book 2019. For an older assessment see: GoM. 2000. Feasibility study final report on Environmental Solid waste management programme, Mauritius. Fichtner GmbH for the Republic of Mauritius; 2000. p. 2-48.

²⁷⁰ Environment Statistics – 2018.

²⁷¹ Mulloo, J. 2016. Le ramassage et traitement de déchets a l'Ile Maurice. Conseil Municipal de la Cite de Port-Louis; Ministry of Environment, Solid Waste Management and Climate Change, 2021; A rate of 1.11 kg/person/day was reported for 2017. Africa Solid Waste Management Data Book 2019. Fitchener (2000) reported 7.9% and Mohee (2002) reported 13% plastic. The National Waste Characterization Study (2013) gives a mean of 9% (10% urban, 7% rural).

²⁷² Kowlessar, P. Plastics Management in Small Islands Developing States. Presentation: [https://www.uncrd.or.jp/content/documents/2654Plenary%20Session\(3\)-Presentation\(6\)-Prakash%20Kowlessar.pdf](https://www.uncrd.or.jp/content/documents/2654Plenary%20Session(3)-Presentation(6)-Prakash%20Kowlessar.pdf)

²⁷³ In 2014, plastic waste was estimated at 38,700 tons. Naldeo and Seureca, 2014. Etude de diagnostic pour une gestion optimisée des déchets dans l'Océan Indien. COI and AFD. On the basis of 9% plastic in solid waste, Charboulliet estimated that 61,635 tons of plastic waste was generated in 2018.

²⁷⁴ Only a proportion of the waste water is treated. In 2000, it was estimated that about 12 percent of solid waste was dumped 'illegally', particularly in rural areas where waste collection was less frequent. See: Foolmaun R K, Chamillal D S, Munhurrun G., 2011. Overview of non-hazardous solid waste in the small island state of Mauritius. Resources Conservation & Recycling, 2011, 55 (11): 966 – 972.

²⁷⁵ Eco-bins are to be installed on beaches and nets at major sea outfalls to ensure that most of the plastic wastes are collected and diverted to recyclers (Budget Speech 2020-2021 Annex).

²⁷⁶ Statistics Mauritius, HS code 5404. Any imported corded netting is considered to be imported for the regional purse seine fishery and does not necessarily contribute to waste in the Mauritius EEZ.

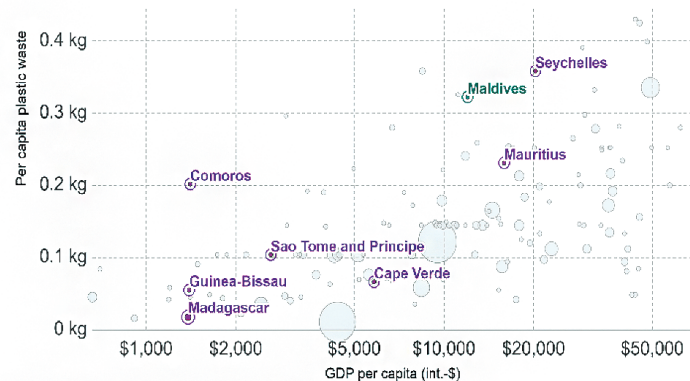

MPP in Mauritius is estimated at about 158 tons per year (Table 16). The sources and assumptions are provided in the table or in the text. As additional or more accurate information becomes available, this preliminary estimated can be adjusted accordingly.

Table 16. Estimated marine plastic pollution in Mauritius

Item	Total	Source/ Assumption
Population total (million)	1,270,000	World Bank 2020
Total waste (tons/year)	571,395	World Bank, What a Waste 2.0; see text
Waste average (kg/person/day)	1.2	calculation
Plastic (%) of waste	10%	assumptions, see text
Plastic waste (tons/year)	57,139	calculation
Mismanaged plastic waste (%)	2%	assumptions, (including litter) see text
Mismanaged plastic waste (tons/year)	1,143	calculation
Transport to marine environment (%)	10%	assumptions
MPP from mismanaged solid waste (tons/year)	114	calculation
Shipping (tons/year)	10	Shipping 10 tons (assumed)
Fisheries (tons/year)	6.7	10% of imports of mono nets 67 tons
Microplastics at least (tons)	17	see table Table 11 tyres only) range 17-102 tons
Non-Mauritius sources	10	assumption (from ocean sources)
Estimated MPP (tons/year)	158	calculation

There is a relationship between plastic waste and income levels (Figure 35).²⁷⁷ The current decrease in Mauritius' GDP/capita may temporarily reduce plastic consumption, although this may be slightly offset by the increase in the use of plastics to combat the pandemic.

Figure 35. Relationship between income and mismanaged plastic waste

Source: Jambeck et al. (2015) & World Bank – WDI

Sources: Barnes, 2019; Jambeck, et al. 2015.

7.1.3 Management of solid waste

Over 90 percent of solid waste is collected either through municipal or private collection schemes. The waste is partially sorted for recycling, composting, or other primary treatment (e.g. e-waste) at five 'regional' sites after which the remaining waste is sent to the sanitary landfill at Mare Chicose. Methane extracted at Mare Chicose is used for production of electricity. A waste characterisation update study was commissioned in 2019 and AFD has funded a study for the new solid waste management strategy

²⁷⁷ Barnes, Stuart J. 2019. Understanding plastics pollution: The role of economic development and technological research. *Environmental Pollution* 249, December 2019. <https://www.sciencedirect.com/science/article/abs/pii/S0269749119306505>

and action plan focussing on resource recovery and recycling.²⁷⁸ Waste separation at source (e.g., by households) is low, but there are plans to initiate a comprehensive waste recycling programme which will include sorting of waste for recycling at producer, or household level. Further separation of wastes is expected to be implemented only when composting plants and sorting units are commissioned and operational in 2023/2024.

The Ministry of Environment, Solid Waste Management and Climate Change has overall responsibility for solid waste management. The local councils are responsible for collection and public cleanliness in their areas. The Beach Authority has responsibility for ensuring collection and disposal of beach litter and debris. The Mauritius Port Authority is responsible for waste generated by shipping.

Figure 36. Mismanaged plastic waste in rural, coastal and urban areas

We-Recycle

L'express

most common beach MPP

Figure 37. Formal waste management

In 2015 about 38 percent of waste was composted. Collection represents about 55 percent of the costs associated with solid waste management, landfill 27 percent of costs and transfers and transport to the landfill 18 percent. Studies suggest that proportion of different types of plastic is similar to that in France.²⁷⁹

7.1.4 Rodrigues

In some ways, Rodrigues has been considered to have a more advanced solid waste management regime than Mauritius island. Rodrigues produces some 15-20 tons of waste per day. The Environment Commission has developed a landfill site at Grenade to cater for the increase in solid waste.²⁸⁰ Plastic bags were banned in 2014. A waste segregation project promoted awareness of recycling of plastic

²⁷⁸ Ministry of Environment, 2020; Gov. of Mauritius/ AFD, 2017. Strategy and action plan for a new solid waste management and resource recovery system for Mauritius and project preparation support for the implementation of the strategy SWMD. Project 16/AFD/CLD/Mauritius/1.

²⁸⁰ KPMG Rodrigues Regional Assembly Final SIDPR July 2009.

and composting of organic waste. Waste is sorted on Rodrigues as a result of the awareness campaign and recycling receptacles have been installed at Port-Mathurin. The Beach Authority Act 2002 also applies to Rodrigues and empowers the Beach Authority to undertake the day to day cleaning of public beaches, establish standards for use (e.g. by traders) and cleanliness;

The 2009 report made the following critical observations (which may no longer be applicable):²⁸¹

- littering and dumping on landscapes and lagoon;
- despite awareness campaigns, the impression was that few Rodriguans are aware of the negative impacts of mismanaged solid waste
- a lack of individual and collective responsibilities and community based rural collection programmes
- lack of awareness in waste reduction activities and existence of some cultural barriers to environment protection and cleanliness;
- pollution by plastic carry bags, empty bottles, used batteries, rocks, used oil, used tyres etc.;
- fragmented approach to waste management due to absence of qualified personnel and lack of innovative waste management technology;
- lack of a civic amenity centres for bulky wastes and lack of proper arrangements for management, collection and disposal of cyclonic wastes.

7.1.5 Plastic pollution on beaches.

The Beach Authority, established in 2002 under the Beach Authority Act, working with the local authorities, is responsible for the maintenance and cleanliness of 130 public beaches(48 km)²⁸² It is supported by recurrent and capital grants and revenues from beach user charges. Expenditures (2017-18) were about \$1.4 million and the recurrent grant covered over 60 percent of expenditures.

The composition of a clean-up at Grande Riviere Noire was over 87 percent plastic by number of items (Table 10). The clean-up collected 8.65 tons of marine debris over 19 km of shoreline (0.46 tons per km). Although the composition of the clean-up was reported by number of items rather than by weight, it nevertheless confirms the importance of plastic waste in the marine debris found on beaches.

Table 17. Composition of marine litter in beach clean-up

Category/ items	Rank	% by number
Plastic (all, incl. fishing gear)		87.4%
Cigarette butts	1	16.7%
Plastic bottles	2	18.4%
Plastic bags	3	9.4%
Food wrappers	4	7.9%
Fishing gear	-	<1%
Litter less than 2.5 cm		
Plastic		77%
Glass		23%

In associations with local authorities, hotels and NGOs, the Beach Authority organises beach clean-ups and awareness events on keeping Mauritius’ beaches clean (Figure 38). However, the composition of the litter is not reported in the organisation’s publications. Tourism is not considered a significant driver of MPP and may provide an incentive to maintain the cleanliness of beaches and waterfronts. However, efforts could be directed to raising awareness on littering by cigarette butts as they are the largest item of beach litter.

Figure 38. Beach clean-ups and awareness events organised by the Beach Authority

Source: Clean-Up Mauritius and Embellishment Campaign Volume 16

7.1.6 Fisheries

As there is no direct information on MPP from fisheries in Mauritius, the estimate given in should be considered as a ‘place-holder’ until such time as further information is available. Both local small-scale and large-scale fisheries and foreign fishing are potential sources of MPP through lost gear and at-sea garbage disposal.²⁸⁴ Losses are generally related to the type of gear and location where the fishing

²⁸⁴ FAO, 2016. Abandoned, lost and discarded gillnets and trammel nets: methods to estimate ghost fishing mortality, and the status of regional monitoring and management. FAO Technical Paper No. 600. Rome. Italy.

takes place. The import of monofilament fishing nets is used as a proxy for an estimation of MPP from local fisheries as the import of multifilament nets is likely to be for the largely foreign tuna fleet which uses Port Louis as a logistic hub, but undertakes limited fishing activities in the Mauritius EEZ.

Small-scale coastal fisheries, industrial tuna fisheries and aquaculture all use nets. In 2019, total import of nets was 604 tons valued at \$3.9 million. As indicated above, in 2019, the imports of monofilament nets were 67 tons and 10 percent of this quantity is considered to be lost or abandoned nets and gear and effectively MPP. A more detailed estimate could estimate losses of lines, buoys, fish boxes and other fishing gear.

The industrial tuna vessels may also lose net material, lines and other gear. In particular, FADs may be lost. While most of the tuna fishing takes place outside Mauritius' waters, lost gear and FADs can certainly drift into the vast EEZ.

7.1.7 Shipping

Galley waste from shipping can be a source of MPP, particularly if the waste disposal arrangements at ports are inadequate. Most major ports have waste reception facilities and implement the controls required under MARPOL Annex V. There are no reported irregularities regarding the access to waste disposal in AIODIS main ports. In addition, in some countries, growing offshore oil/gas exploration activities can be a source of MPP and effective waste management may require to be specified or included in any revisions of the legislation on marine pollution or in the terms and conditions of concessions.

Figure 39. GRP boats and tourism are sources of MPP

In addition to MPP from shipping, the construction and disposal of fiberglass (GRP) boats for fishing or leisure is a potential source of MPP, particularly as GRP presents difficulties in recycling. Disposal of GRP boats can be costly, such that owners may allow boats to sink or 'rot' on the beach.

7.1.8 Ocean current and MPP

Other than fisheries and shipping, the main external source of MPP is the waste carried from Southeast Asia and possibly a smaller amount from South Asia. Although the models suggest that this MPP passes to the north of Mauritius island, it is washed up on St. Brandon and Agalega and may also be trapped in shallower areas of the Mascarene plateau.

Figure 40. Shipping traffic density, current eddies and plastic carried by ocean currents (model)

Images : AIS shipping, surface currents, model of plastic transport

A 2010 survey on 15 St. Brandon islets (38 km of shoreline) recovered 50,000 items of which 79 percent were plastic. Flip-flops alone were 23 percent. The labelling indicated the products were mostly of Asian origin (i.e., brands not sold in Mauritius).²⁸⁵ As St. Brandon is some 3,350 km from the source of these items, they have either been transported by the South Equatorial Current and Equatorial Counter Current or dumped from fishing or cargo vessels. However, specific information on the quantities of MPP arriving in Mauritius is not available and beach clean-up activities do not sort debris by possible origin. Studies of beach debris in South Africa suggest a useful approach to determining origins.²⁸⁶

7.1.9 Microplastics

The level of marine microplastic pollution depends on a wide range of factors. Population, density of housing and the type of treatment of waste water are important. In Mauritius, the hydrography and high rainfall means that a significant proportion of microplastic pollution is likely to get flushed into the ocean.²⁸⁷ The main sources are likely to be road runoff of rainwater containing microplastics from car tyre abrasion; untreated waste water (microbeads in cosmetics, cleaning agents, laundry); and air-borne microplastics resulting from paints, building materials and breakdown of macroplastics by wind and sun.

Microplastic pollution is estimated on the basis of car tyre abrasion which is considered to be the main source of marine microplastic pollution. It is estimated (i) on the basis of tyre imports and (ii) on a generic loss of tyre mass per vehicle (Table 18). In 2018, the stock of motor vehicles in Mauritius was approximately 556,000, each of which generates about 1.8 kg of microplastic waste per year, as tyres are compound of plastics and rubber.²⁸⁸ Mauritius imported over 1600 tons of tyres in 2019. As

²⁸⁸ Statistics Mauritius, 2018. Tyres contain up to 30% plastic resins and/or textiles.

the area of surfaced/tarmac road substantial in Mauritius, microplastics from tyre abrasion are likely to be washed into storm drains and into the sea. Microplastic pollution may also be generated by the textile industry although clothing made from synthetic fabrics are not usually washed prior to sale. Mauritius imported over 4,200 tons of synthetic fabrics in 2019, all of which are plastics. The possible contribution to microplastic pollution by the textile and garment industry has not been established.²⁸⁹

The preliminary estimate of microplastic marine pollution ranges from 17-102 tons/year as set out in Table 11. The table is provided as a basis for more accurate future estimates.

7.2 Existing and potential measures to combat MPP

7.2.1 Policy and planning

The concept of 'Maurice Ile Durable' and the 'Achieving Meaningful Change' address (2015) underpins a wide range of policies focused on a sustainable economy.²⁹¹ Mauritius does not have specific policy or plan to combat MPP and an updated national strategic plan on solid waste management (SWM) is being implemented. The National Environment policy identifies sustainable consumption as an aim and stresses the 'reduce, reuse, recycle' approach.

A wide range of regulations exist, in particular under the Environment Protection and the Local Government acts. Act. Mauritius is party to the relevant international conventions on waste management and has the required action plans and other measures, e.g., for medical waste, for dangerous chemicals, and for implementation of obligations under international conventions (e.g. Basel, Bamako, mercury). The responsibilities of the various actors have been described above.

7.2.2 Regulation.

Selected legislation of relevance to MPP is listed below (Box 15). The 'plastic' regulations require permits to import, or manufacture. Collection of wastes also requires a permit which may constrain informal collection. The older plastic bag regulations are not considered to be effectively implemented. The plastic bag regulations are being amended to include possession of plastic bags as an offence; and to delist transparent roll-on bags and pocket bags of less than 300 cm² as exempted plastic bags.²⁹²

7.2.3 A national MPP action plan?

Within the context of a national integrated solid waste management strategy a national action plan on MPP could be prepared.²⁹³ A specialised MPP working group could be established within a national solid waste task force. The key actors could include, e.g., environment ministry, municipal authorities, finance ministry, chamber of commerce, media representatives and concerned NGOs. The MPP working group could include the Beach Authority, fisheries administration, marine and port authorities, tourism stakeholders and enterprises involved in the plastics and retail industries. The closely related development of the circular economy may require an additional and more industry/innovation/ investment- targeted working group.

A strategic action plan on MPP could include some or all of the following elements:

- anchoring the action plan in existing policies, plans, legislation and institutions
- establishing more precisely the scale of MPP, the main causes and the responsibilities for addressing those causes

²⁹³ The 2017 Strategy and Action Plan proposes a range of stakeholder coordination initiatives.

- set out a vision of a low/no plastic waste society identifying long-term aspirational goals, immediate and longer-term actions, suggested investments and means of coordination, monitoring and review.
- suggest awareness campaigns targeted at decision-makers, local authorities, consumers and businesses or other priority targets
- development of codes of conduct to reduce plastic waste and MPP, e.g. through tourism organisations, cruise lines, supermarkets, beach users and fisher associations
- develop a coordinated approach by businesses engaged in plastic waste sorting, reuse and recycling, including in relation to EPR schemes, fiscal measures and possible cross-support to value chains which may be less economically viable (e.g. waste transport from Rodrigues)
- identify the resources and financing which may be required, including for innovation and the plastics circular economy, and in particular any catalytic measures required
- consider regional initiatives, including on exploring opportunities for harmonised product bans or 'environmental import tariffs'; for regional 'agreements' with major soft drinks suppliers for economies of scale in regional EPR and recycling (see 6.3.8).

7.2.4 Fisheries

Mauritius coastal fisheries (including Rodrigues) harvest about 3,500-4,000 tons per year with about 1,000 tons attributable to the sport/ amateur fishery.²⁹⁴ About 2,000 small wooden, or GRP vessels are used. Because of the rocky and coralline sea bottom, it is likely that a significant amount of netting and lines are lost.²⁹⁵ A relatively small aquaculture industry also uses nets for sea cages.

Given the nature of the small-scale fisheries, comprehensive marking of fishing gear and 'fishing' for lost gear may not be practical, except near marine parks or prime tourist/ dive sites, or where volunteer divers can be used.²⁹⁶ Designation of sites for collection of waste fishing gear, possibly through the fisheries associations, and EPR arrangements with importers to ensure responsible disposal could be of value in addressing fisheries MPP. Pilot schemes could be considered in areas where there are existing fisheries management plans. EPR initiatives could also be initiated at a regional level through the Fédération des Pêcheurs Artisans de l'Océan Indien, (FPAOI).

FADs are likely to be a source of marine debris from the tuna fleet, which also fishes in other WIO countries. Analyses of beach litter from other WIO countries suggest that garbage from Asian fishing vessels can contribute significantly to MPP, even if not fishing in the Mauritius EEZ.

For larger, 'port-based' vessels, reception facilities based on MARPOL Annex V requirements can be applied to fishing vessels.²⁹⁷ Recycling of nets and ropes may require the economies of scale which may only be feasible through regional schemes (e.g. catalysed by SWIOFC, IOTC, or IOC), through close engagement with businesses and possibly with economic support from EPR arrangements with importers.

²⁹⁴ Kelleher, K. 2017. Fisheries and aquaculture. Chapter in: The Ocean Economy in Mauritius. Making it happen, making it last. World Bank

²⁹⁵ In the EU, about 20% of fishing gear is lost annually. However, this varies considerably by area and gear. Fishers report a relatively low loss of gillnets in the EU (<5%).

²⁹⁶ Small-scale fishers often create local or 'proprietary' systems of marking fishing gear to prevent theft, or help in the recovery of lost gear.

²⁹⁷ Huntington, T.C., 2016. Development of a best practice framework for the management of fishing gear. Part 2: Best practice framework for the management of fishing gear. Confidential report to World Animal Protection; Also see the Global Ghost Gear Initiative.

There are a range of guidelines available to prevent marine debris from fishing vessels. Workshops have been held, but it is unclear to what extent best practices are implemented in Mauritius, or regionally. A 2019 African regional workshop indicated a generally low level of awareness on the scale of lost or abandoned gear and nature of appropriate solutions.²⁹⁸

Reduction of MPP from foreign fishing vessels requires a regional approach, particularly as foreign vessels may land catches elsewhere (e.g., Victoria, Durban) and may not make port calls to Mauritius. This could start with resolutions by IOTC and SEAFO, possibly phasing in MARPOL Annex V requirements for vessels; introducing measures with respect to marking gear and FADs; and specifying responsibility for recovery of lost gear. Enforcement could be through the PSMA. Appropriate requirements could eventually become part of minimum terms and conditions of access, included in licenses for vessels and could be an approved regional management measure. Fisheries support vessels could be included in such a scheme. FAO could be requested to provide support for design of a phased approach and the issue could be raised in the context of any future EU fisheries access agreement.

Although many small-scale fishing vessels are wooden, fibreglass (GRP) fishing vessels and other GRP vessels are progressively reaching the end of their useful life. Abandoned GRP vessels present a growing plastic waste problem and are likely to progressively degrade to marine microplastics if abandoned. Most countries have no provision for appropriate disposal of GRP vessels. Rules for their disposal are required and the responsibilities specified. Measures could include a requirement that the annual vessel registration fee is paid until appropriate disposal is certified. EPR schemes may be difficult to design given the life of these boats.

7.2.5 Shipping and tourism

Ensuring that Mauritius meets its obligations under MARPOL Annex V is the key action required. Mauritius Ports Authority (MPA) is responsible for all Mauritius ports. The MPA Port Waste Management Plan covers the management of all types of prescribed wastes under MARPOL for vessels calling at Port Louis. A 2018 Memorandum of Understanding between the MPA and a private company enables cleaning of floating debris from the port on a daily basis.²⁹⁹ IMO auditors plan to carry out an audit of Port Louis Harbour on specific port control and environmental aspects by February 2020.³⁰⁰ The MPA Quality and Environmental Policy Statement reads:

“reduction of waste through responsible use of resources and as far as practicable favour the reuse, recycling and purchase of materials from sustainable sources [and that] relevant ISO Standards requirements including those pertaining to identified environmental aspects [will be applied].”³⁰¹

²⁹⁸ Macfadyen, G., Huntington, T., and Cappell, R. 2009. Abandoned, lost or otherwise discarded fishing gear. ³⁰¹ See also: Mohee, R. et al. 2012. Inventory of waste streams in an industrial port and planning for a port waste management system as per ISO14001. Ocean & Coastal Management Volume 61, June 2012, Pages 10-19. During the period April 2009 to May 2010 plastics represent 60% of ship waste and 608–782 tons of waste are expected on the waterside by 2014 (UNEP GEF WIO-Lab Solid Wastes Demo Project).

Dialogues with vessel operators and ships agents may help in separation of recyclables in ship's garbage.³⁰² Dialogues with IMO and regional port authorities could help ensure coordinated measures to prevent dumping of waste by shipping in the region and to foster codes of conduct for regional shipping lines.³⁰³ MARPOL Annex V also applies to the disposal of garbage from fixed or floating platforms engaged in the exploration or exploitation of seabed oil and gas and should be stipulated in the relevant authorisations.

7.2.6 Circular economy

Mauritius already implements a number of circular economy initiatives in relation to plastics. A number of corporations, NGOs and local associations are engaged in recycling, export of plastic waste, manufacturing using recycled waste and a number of studies have explored various economic and technical aspects of reduction, reuse and recycling. The studies focus on separation of wastes, possibilities for PET recycling, and a range of related challenges.³⁰⁴

The Government of Mauritius has introduced sustainable public procurement which aims at making public expenditure more sustainable in terms of social, environmental and economic policies.³⁰⁵ Eco-bins are to be made available for collection of plastic wastes and the Ministry of Environment is to promote separation of waste at source. Importantly, recycling activities are to be classified as a manufacturing activity in order to benefit from fiscal and other incentive schemes.³⁰⁶

The 'PET Bottle Regulation' is a form of EPR and places the onus for disposal on the bottling companies. In response, the Mauritius Bottlers Association (MBA) introduced a form of deposit/return scheme at supermarkets and beaches and payments of \$0.25 per kg of PET, which is then flaked and exported with about 40 percent of the bottles passing through this system. Box 16 lists enterprises and organisations involved in plastic waste reuse or recycling.

Despite the recent inclusion of recycling as manufacturing, the sector is reported to have a number of constraints. These include:³⁰⁷

- lack of effective legislation and standards for export of waste plastics
- lack of incentives from the Government.
- high cost of collection and transportation of the wastes
- relatively high cost of labour and shortage of technical skills
- low public awareness.

Note: Since China's ban on waste plastic imports and the recent requirements under Basel, some of these enterprises may not be active in the export of waste plastic. This provisional list can benefit from verification and updating.

As a result of the island economics and tourist market a range of up-cycling innovations have been developed.³⁰⁹ Several reports outline alternative approaches to re-use and recycling, including practices, economic and financing issues and lessons from Asia and small islands.³¹⁰ The companion report on circular economy, prepared under this project, also provides additional perspectives.

7.2.7 Awareness of MPP

While Mauritius has ratified the Nairobi Convention's LBSA Protocol, MARPOL Annex V and enacted national legislation on plastic bag and SUPs, and despite various campaigns promoting recycling and combatting litter, there is reportedly a generally a low level of awareness of MPP.

A key foundation for a coherent awareness campaign is the national waste management plan upon which a strategy to combat MPP can be developed. Any awareness campaign on MPP can be built on this foundation and target specific groups and issues, such as decision-makers, retailers, beach users, or environmental education in schools. Under the 2017 Plan, a range of education and awareness campaigns are proposed.³¹¹ Generic approaches to developing a MPP strategy and awareness initiatives are described in the main report. However, Mauritius has a range of existing initiatives through which awareness is already being raised and public engagement is increasing.³¹²

The 2019/20 Budget made provision for a national campaign on household waste separation and provision of bags for the segregation.³¹³ Ideally a campaign will set out the economic, conservation and aesthetic arguments to enlist consumers, businesses and public representatives in a shared vision of clean beaches and waters, while specific campaigns target behaviours (e.g. disposal of cigarette butts), or lay the groundwork for a ban on products with microbeads. Mauritius has a high literacy rate, so mandatory labelling of plastic products and containers to encourage recycling or proper disposal could be useful. Awareness campaigns could potentially be associated with other initiatives on health, water, sustainability, or conservation in order to lower costs and link messaging to community priorities or projects.

7.2.8 Possible regional initiatives

Prevention, reduction, or control of MPP from foreign sources requires regional (and global) action. In cooperation with other countries, Mauritius could consider several initiatives:

- preparation of a joint strategic plan on MPP under the Nairobi Convention
- a COP resolution on monitoring and reporting on MPP and marine microplastic pollution as part of the implementing arrangements for the Nairobi LBSA Protocol
- preparation of a funding submission by the Nairobi Convention secretariat for a regional MPP monitoring programme, including from distant sources, collating information on beach clean-ups through existing initiatives, and preparation of a strategic plan on MPP
- further use of the regional projects supported by the IOC and Cap Business (e.g. in relation to recycling of PET bottles).

In conjunction with other countries, Mauritius could also consider initiating a dialogue in the regional economic commissions (COMESA, SADC) on trade issues related to MPP and plastic waste management in general. In particular, regional arrangements on trade in plastic waste (and other recyclable waste) would be useful to enable economies of scale in recycling. Regional measures to reduce or eliminate un-necessary plastics, such as microbeads in household products and selected SUPs would also foster innovation in development of local substitutes. Regional initiatives could also underpin a dialogue on EPR with regional suppliers, such as agents for fishing nets, soft drinks (e.g., development of regional deposit return schemes). Regional measures also invoke market power in relation to the behaviour

³¹¹ See the GoM/AFD 2017 Plan, Strategic Area V, which proposes 8 inter-related tasks, including enhanced stakeholder consultation/ cooperation and waste monitoring and 30 awareness/ education campaigns per year over 2 years with a cost of about \$350,000.

³¹² Clean-Up Mauritius and Embellishment Programme - «Moris Nou Zoli Pei»; <https://www.preciousplastic.mu/>; <https://sst.org.za/projects/african-marine-waste-network/wiomsa-marine-litter-monitoring-project/mauritius/>.

³¹³ Budget Measures for Financial Year 2019/20

of major users of plastics (e.g. PET bottles), can underpin dialogues with major corporate sources of MPP (such as bottled drinks manufacturers - see main report), and inform ongoing discussion on plastic and the environment within the WTO.

At the level of AIODIS and Africa, Mauritius could consider contributing to a common AIODIS position on MPP, possibly with a view to consolidating actions and positions through existing AMCEN and SIDS initiatives. Such engagement could also contribute to the oceans agenda of UNGA and UNEA.³¹⁴ A regional action plan could also enable access to resources, including from global partnerships on plastic waste (see main report).

The main project report provides greater detail and discussion of option for recycling of plastic waste and resourcing and financing opportunities. Reference can also be made to companion report on the circular economy (in preparation under a separate consultancy).
